

Gatewatcher is the first platform for digital breach detection (Intrusion Detection System) to be developed in France. Our unique technology detects the most advanced threats, made with the most crafted exploitation methods (polymorphism, obfuscation, encoding, ROPchain...) and the threats based on all types of malicious files (ransomware, cryptolocker...). The project was started in 2015 by engineer, Jacques de La Rivière, and security expert, Philippe Gillet. Gatewatcher's team is composed of experts in security, networks, systems, encryption and machine learning. During the 2016 edition of the FIC (Forum International Cybersecurity), Gatewatcher was awarded the French Cybersecurity accreditation rewarding innovation in the cyber defence field. It's also being certified by ANSSI (French Cybersecurity Agency) and meets the requirement of the Military Planning Act.

You'll join our R&D department and participate in enriching our detection and shellcode analysis solution. We're looking for an intern to work with us on python projects. Python knowledge and personal project (on Github) would be strongly appreciated.

Your skills:

- Python
- C Language
- Project management

In a few words

Sector: cybersecurity

Position: Python developer

Contract: internship (6 months)

Location: 42, Rue Washington, 75008 Paris

Remuneration: depending on profile
